## GLAZ

### WINDOW GLAZING for locos, coaches & buildings

Four pieces  
250 x 24 x 0.5mm  
thickness sheet,  
with double-sided  
protective  
polythene film to  
ensure a scratch-  
free life in storage  
and application.

Gives a bright,  
clear glass look to  
all your models in  
any scale.

Easily fixed with  
contact adhesives.

Glaze flush windows  
and bolections or  
droplights with  
separate panes of  
glass for the best  
effect.

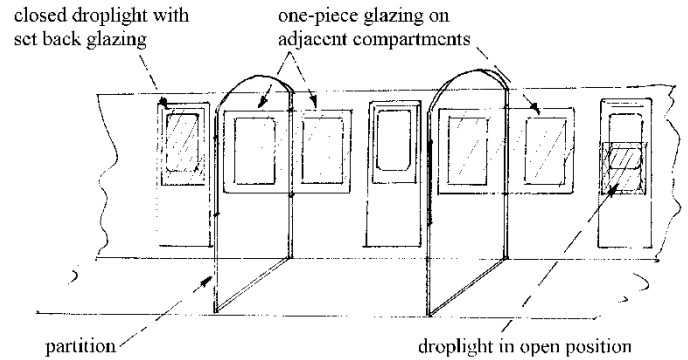

Score both sides of  
the glazing with a very  
sharp craft knife with  
the polythene film still  
in position. The  
glazing will usually  
break cleanly along  
the line.

Offer up to the  
opening to check for  
size and if no further  
trimming is required  
then peel off **one** side  
of the protective film  
and apply a neat line  
of adhesive either to  
the frame to be glazed  
or to the edges of the  
glazing. Do not use  
superglue as this will  
fog the glazing.

With the film side next  
to your finger, gently  
locate the glazing and  
secure in position.

A piece of blutack on  
your finger or on a  
short stick is a big  
help in gaining access  
to awkward places.

When set, don't forget  
to remove the  
protective film from  
the other side. Or  
leave it in place for a  
frosted glass effect,  
although we can't  
guarantee that future  
batches will have an  
opaque film.
